

## Feedback for current work:

1. "Requirements and use case diagram short description" document
  - a. The glossary is fine
  - b. The function requirements are fine. Great to make use of MoSCoW method for priority.
  - c. The Non function requirements must include performance (e.g. command responses in less than 5 seconds) .
  - d. The Non function req. 7 you mention modular build, but does the project also include scalability?
  
2. "Bachelor diagrams" document
  - a. Fine to add the Administrator actor
  - b. Fine Activity diagrams.
  - c. Make use of the same actor role naming from use case diagram to the System Sequence diagram
  - d. The domain model includes "Physical" device, but this is not shown in the use case diagram?
  
3. "Use case description" document
  - a. General remark: One browser is fine for the proof of concept!
  - b. The "Manage user profiles" and "Manage device" does not have Alternative flow and comments included in the use case description?
  
4. "Test cases" document
  - a. Should the "Monitor Electricity Consumption" include time interval (time period)?
  - b. Why remove device in the "Visualize Historical Data"?
  - c. I can't see the "Register/Edit User Profile" includes edit functionality?
  - d. Can the end user (Subscriber) make the acceptance tests based on your descriptions?

## Action Points:

1. Non-functional include performance
2. Non-functional requirements also scalability
3. Make sure sequence diagrams same actor name
4. Add device as an actor
5. Change to one browser
6. V-model design
